

Claims

1. A method of configuring parameters of an M2M (machine-to-machine) module, the method comprising establishing a connection between the M2M module and a server, characterized by the method comprising:
5 ing:

(304) downloading, to the M2M module, an application having an interface for configuring the M2M module, the application being configured to run on a Java virtual machine (JVM);

(306, 308) communicating with the server by the application for receiving configuration parameters; and
10 ceiving configuration parameters; and

(310) setting the parameters of the M2M module by the application based on the received configuration parameters.

2. The method of claim 1, characterized in that the connection between the M2M module and the server is established through a M2M
15 gateway or over a TCP/IP connection.

3. The method of claim 1, characterized in that the communicating with the server comprises: requesting (306) configuration parameters from the server and receiving (308), in the application, the configuration parameters from the server.

4. The method of claim 1, characterized by the application being a Java 2 Micro Edition (J2ME™) application.
20

5. The method of claim 3, characterized by the application being a Java MIDlet or a Java IMlet.

6. The method of claim 1, characterized by the application being downloaded to the M2M module over a cable, over an infrared connection or over-the-air (OTA).
25

7. The method of claim 1, characterized by the application programming interface being a Common Object Request Broker Architecture (CORBA) API.

8. The method of claim 6, characterized by communicating with the server by making a method call through the CORBA API.
30

9. The method of claim 1, characterized by using the M2M module (110) for configuring parameters of a remote device based on the configuration parameters received from the server.

10. An M2M (machine-to-machine) module (110), comprising:
means for operating a Java virtual machine (122) and means (124) for establishing a connection between the M2M module (110) and a server (118),

5 characterized by the M2M module (110) being configured to:
download an application (120) having an application programming
interface (API) (124) for configuring the M2M module, the application (120)
being configured to run on a Java virtual machine (JVM) (122);

communicate with the server (118) by the application (120) for receiving configuration parameters; and

10 set the parameters of the M2M module (110) by the application
(120) based on the received configuration parameters.

11. The M2M module of claim 10, characterized in that the
M2M module (110) is further configured to request, by the application, configuration
parameters from the server (118) and receiving, in the application, the
15 configuration parameters from the server (118).

12. The M2M module of claim 10, characterized in that the
application (120) is a Java 2 Micro Edition (J2ME™) application.

13. The M2M module of claim 10, characterized in that the
application (120) is a Java MIDlet or a Java IMlet.

20 14. The M2M module of claim 10, characterized in that the
M2M module (110) is configured to download the application (120) over a cable,
over an infrared connection or over-the-air (OTA).

15. The M2M module of claim 10, characterized in that the
application-programming interface (124) is a Common Object Request Broker
25 Architecture (CORBA) API.

16. The M2M module of claim 15, characterized in that the
M2M module (110) is configured to communicate with the server (118) by making
a method call through the CORBA API (124).

30 17. The M2M module of claim 10, characterized in that the
M2M module (110) is used for configuring parameters of a remote device (112)
based on the configuration parameters received from the server (118).
